

Amendments to the Claims:

This listing of claims will replace all prior versions and listings of claims in the application:

Listing of Claims:

1. (currently amended) A method for selectively disabling resubmission of an HTTP request comprising:

receiving input relating to a functional group having a unique key, wherein a functional group comprises two input controls identified by the unique key and
5 wherein an activation flag is associated with the unique key;

determining whether ~~a member~~ one of the input controls of the functional group has been previously activated based on a setting of the activation flag; and

when ~~a member~~ one of the input controls of the functional group has
10 been previously activated, selectively disabling ~~the resubmission of the HTTP submission of a~~ request based on the received input for the functional group.

2. (currently amended) The method of claim 1, further comprising:

when ~~no member~~ none of the input controls of the functional group has been previously activated, updating ~~a data store~~ the activation flag associated
15 with the unique key for the functional group to indicate that a member of the functional group has been previously activated and then submitting the [[HTTP]] request.

3. (currently amended) The method of claim 1, wherein the act of selectively disabling ~~the resubmission of the HTTP request~~ comprises:

20 determining a confirmation attribute value; and

when the confirmation attribute has a first value, selectively displaying a first message indicating that a related response has been previously submitted and including a control to enable the resubmission of the HTTP request.

4. (currently amended) The method of claim 1, wherein the act of

selectively disabling ~~the resubmission of the HTTP request~~ comprises:

determining a confirmation attribute value; and

when the confirmation attribute has a second value, selectively displaying
a second message indicating that a related response has been previously
submitted and including no control to enable the resubmission of the HTTP
request.

5. (currently amended) The method of claim 4, wherein the act of
selectively disabling ~~the resubmission of the HTTP request~~ further comprises:

when the confirmation attribute has a first value, selectively displaying a
first message indicating that a related response has been previously submitted
and including a control to enable the resubmission of the [[HTTP]] request.

6. (currently amended) The method of claim 5, wherein the act of
selectively disabling ~~the resubmission of the HTTP request~~ further comprises:

determining an input value provided in response to the first message; and
when the input value is affirmative, resubmitting the [[HTTP]] request.

7. (currently amended) A method for selectively disabling resubmission of
an HTTP request comprising:

receiving a first web page comprising a functional group associated with
an identifier, wherein the functional group comprises a plurality of input controls
as members, each of the input controls affecting submission of a request and
being identified as the functional group members by the identifier, and wherein a
flag is associated with the identifier, the flag having a value indicating activation
of any of the members of the functional group;

receiving input relating to a ~~member~~ one of the input controls of the
functional group;

submitting a response based on the received input relating to the member
of the functional group;

selectively disabling ~~resubmission of an HTTP request~~ submission of a
request based on the received input when the value of the flag indicates prior

activation by disabling a submission capability for each of the members of the functional group.

8. (original) The method of claim 7 further comprising:
receiving a second web page in response to the submission of the first
5 web page;
receiving input relating to a back function;
redisplaying the first web page on a network device; and
rendering the first web page from a cache associated with the network
device.

9. (currently amended) The method of claim 7 further comprising:
receiving input relating to a member of the functional group;
determining a confirmation attribute value;
when the confirmation attribute has a first value, displaying a first
message indicating that a related response has been previously submitted and
15 including a control to enable the ~~resubmission of the HTTP~~ the submission of
the request; and
when the confirmation attribute has a second value, displaying a second
message indicating that a related response has been previously submitted and
including no control to enable the ~~resubmission of the HTTP~~ the submission of
20 the request.

10. (currently amended) A network device for selectively disabling
resubmission of an HTTP request comprising:
a network communication interface configured to receive a web page
comprising a plurality of input controls from a network, wherein at least two of
25 the plurality of input controls are group members of a functional group;
an input device configured to receive user input relating to resubmission
of the HTTP request; and
a processor configured to selectively disable resubmission of the HTTP
request when a functional group member has been previously submitted.

wherein the resubmission is selectively disabled by determining whether confirmation for the HTTP request is allowed and when determined allowed, resubmitting the request.

11. (original) The system of claim 10, wherein the processor is additionally
5 configured to selectively allow resubmission of the HTTP request when a functional group member has been previously submitted and an affirmative input is received from the input device.

12. (original) The system of claim 11, wherein the processor is configured to
cause an output device to display a first message indicating that a related
10 response has been previously submitted and including a control to enable the resubmission of the HTTP request.

13. (original) The system of claim 12, wherein the processor is additionally
configured to cause an output device to display a second message indicating
that a related response has been previously submitted and including no control
15 to enable the resubmission of the HTTP request.

14. (original) The system of claim 13, wherein the processor is configured to
cause the first message to display when a confirmation attribute is set to a first
value and the second message to display when the confirmation attribute is set
to a second value.

20 15. (currently amended) A system for selectively disabling resubmission of an HTTP request comprising:

a network communication interface configured to receive a web page
comprising a plurality of input controls from a network, wherein at least two of
the plurality of input controls are group members of a functional group;

25 input device means configured to receive user input relating to resubmission of the HTTP request; and

processor means configured to selectively disable resubmission of the
HTTP request when a functional group member has been previously submitted,

wherein the resubmission is selectively disabled by determining whether confirmation for the HTTP request is allowed and when determined allowed, resubmitting the request.

16. (currently amended) A computer program product, comprising a
5 computer readable medium having computer code embodied therein for
selectively disabling resubmission of an HTTP request comprising:

computer readable program code devices configured as a network
communication interface configured to receive a web page comprising a plurality
of input controls from a network, wherein at least two of the plurality of input
10 controls are group members of a functional group;

computer readable program code devices configured to receive user input
relating to resubmission of the HTTP request; and

computer readable program code devices configured to selectively
disable resubmission of the HTTP request when a functional group member has
15 been previously submitted, wherein the resubmission is selectively disabled by
determining whether confirmation for the HTTP request is allowed and when
determined allowed, resubmitting the request.
